Problem Statement

Pakistan has seen a large-scale spread of COVID-19 with **unusual patterns** across the country. Hence, the need for a strong **national coordinating level** for uniform implementation of control measures, as well as the relevance of local forecasting is inevitable now. In this research, we would develop a **spatial and temporal** based **COVID-19** predictor for **Pakistan**, to predict which regions will be most affected and when. Moreover, this predictor would provide decision-makers with enough time to intervene in the local policy.

Motivation

- **Differences** in epidemic dynamics.
- Spatial-Temporal based predictors are highly **successful** (So far, not implemented for Pakistan)
- Determining the **peak**.
- Provide **a clear picture** of which regions will be most affected and when.
- Assist public **decision-makers** in better planning health policy.

NCOC
Government of Pakistan

Background

- Spread of COVID-19 is following **geographic pattern**.
- High probability that COVID-19 also follows **spatial pattern** like Influenza, malaria, dengue and etc.
- Infectious diseases have a **specific geography** too.
- Infectious diseases are strongly correlated with **human mobility**.

Literature Review

- Spatial-temporal spread pattern was found using **geographic clustering and hotspot identification** methods (“Space-Specific”).
- **Tobler’s 1st law** of geography depicts, “where is the disease concentrating and in which direction it is spreading?”
- Spatial prediction is based on **demographic variables** like total population, health infrastructure and etc.

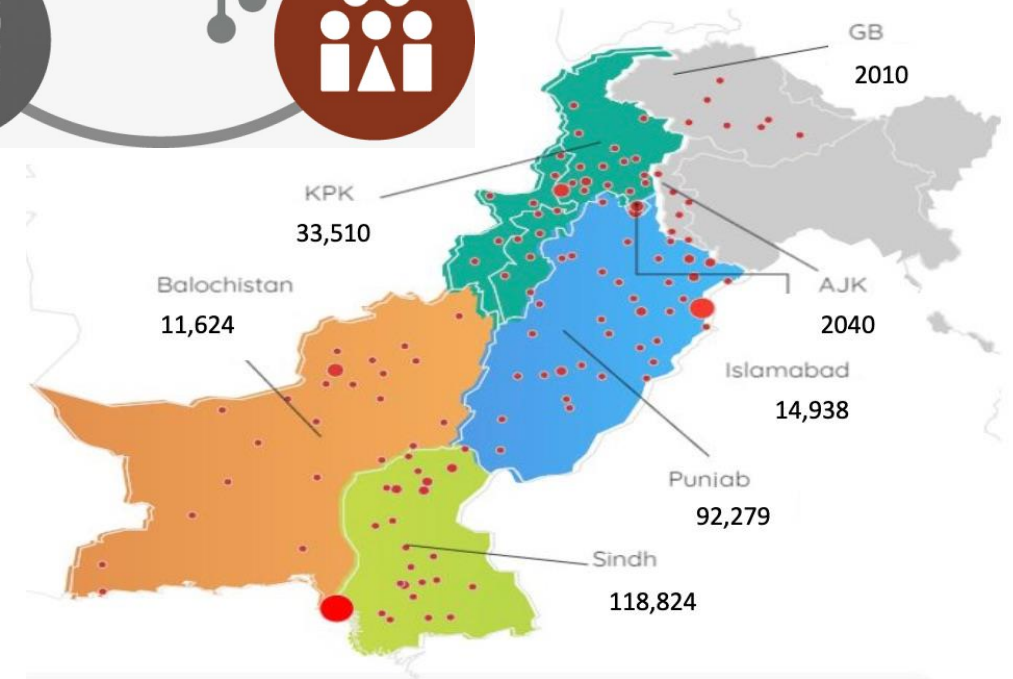

Everything is related to everything else, but near things are more related than distant things.

-Waldo Tobler

Project Objectives

- To determine the **influencing factors** which can increase or decrease the rate of spread of COVID-19 in Pakistan.
- To develop a **machine learning based spatial-temporal predictor** for forecasting the rate of COVID-19 spread in Pakistan.

Methodology

1. FYP-I

1. Data Collection
2. Data Analysis

2. FYP-II

1. Design Model for Prediction
2. Testing

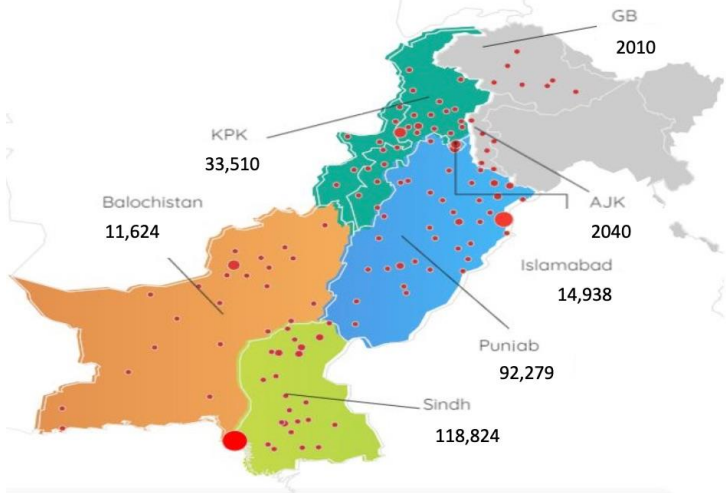

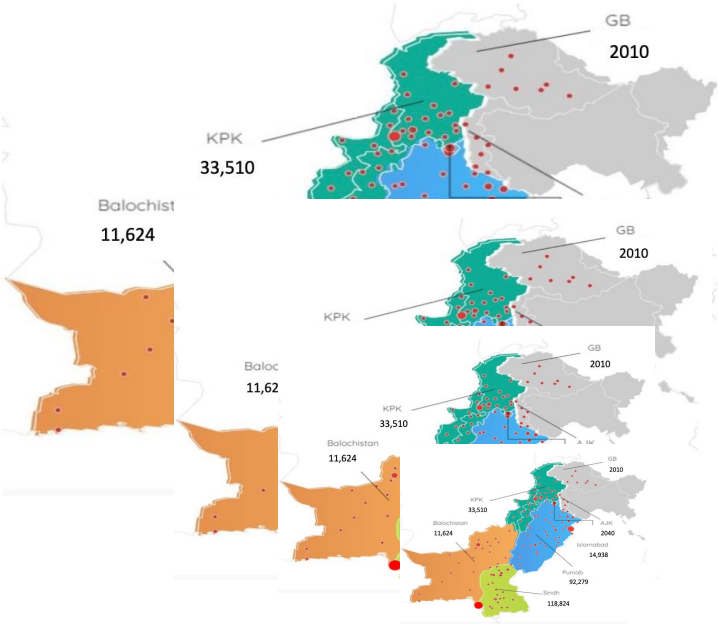

PREDICTION

Final Deliverable

Predictor for forecasting the rate of COVID-19 spread in different regions of Pakistan.

Predictor for forecasting
the rate of COVID-19 spread
in different regions of
Pakistan.

Features for Data Collection (Tentative)

1. Number of doctors/frontline workers available
2. Number of Beds/Ventilator available in the hospitals.
3. Occasions (Jalsa/Festivals/National Days)
4. Airport policies, bus stand traffic.
5. Population density
6. Pollution
7. Climate/weather (Temperature, Humidity)
8. Implementation of social distancing
9. Employment rate & Unemployment rate
10. Amount of COVID testing
11. Timely response/Policies of government
